

Mesa Controls — Maintenance Brief

Scheduled service instructions for research HMI environment.

Window: 2026-09-24, 18:00–20:00 MT Ticket: MC-4822

Scope: HMI display profile refresh (training mode only)

Background

Mesa Field Services is refreshing the operator display profile used on the research HMI workstations. The refresh aligns screen layouts with the training curriculum and does not change controller logic, setpoints, alarm limits or network configuration.

Procedure

1. Confirm with the lab supervisor that the HMI workstation may enter maintenance mode.
2. Place the workstation in maintenance mode and note the start time in the lab log.
3. Apply the display profile supplied by Mesa Field Services for this ticket.
4. Verify the operator overview, trend and alarm summary screens load normally.
5. Confirm no controller values changed during the maintenance window.
6. Return the workstation to production mode and record completion in the lab log.

Rollback

If any screen fails to load, restore the previous display profile from the lab backup and contact Mesa Field Services before retrying.
